ABSTRACT

The Technical Education and Skills Development Authority (TESDA) in Guiguinto, Bulacan, aims to provide essential information, education, and skills related to their programs. TESDA is currently facing challenges in its manual management of training curriculum particularly with regards to accessibility and connectivity concerns that prevent some applicants from accessing online training courses.

To solve these issues, researchers propose solutions that integrate The Curriculum Management System, which includes offline content delivery mechanisms and data analytics to prioritize course development based on demand. This system is designed to improve vocational education development, delivery, and evaluation processes, while also simplifying administrative tasks, promoting collaboration among stakeholders, and continuously enhancing the quality of vocational training.

The essential component of this system is Descriptive analysis, acting as a powerful tool for educators to measure the effectiveness and popularity of their curriculum. It measures prior performance, finds areas for development, and evaluates each to improve academic outcomes by analyzing student involvement and participation. curricular component carefully through systematic evaluation. This method of assessment also permits curriculum variations

CHAPTER I

INTRODUCTION

This chapter presents the context of the capstone project that discusses what the study is all about, emphasizing the issues or problems the researchers would like to resolve. The purpose and description would present the general description of the project, including its salient features that could help the target client. The study's objectives are also presented in this section to enlighten the readers on what the researchers aim to achieve. Lastly, the scope and delimitations are included in the last part to clearly identify what the researchers can and cannot include in their project, given the available resources and time constraints.

Project Context

Curriculum Management manages all educational activities related to curriculum. It is critical to educational activities, because educational aims are realized via instruction. Although there has not been a clear definition about what curriculum management is, which could be issued by authorities or agreed to by the research circle, in varied aspects within a diversity of processes, fruitful curriculum management studies have answered what to teach and how to teach (Jin, 2019).

In today's fast-paced and ever-evolving business environment, organizations must continually invest in the development of their employees' skills to stay competitive. Vocational skills training is one of the best tools to help individuals participate in the labor market, boosting productivity and working conditions, especially for disadvantaged people (Pilz & Mahavira, 2019). To achieve this, many organizations rely on training and skills development programs and several technologies can be used for skills and training management curriculum one of this is the Content Management System (CMS), which provides a comprehensive software platform that

enables users to create, manage, and publish digital content that improve the quality and effectiveness of their online content. Some of the primary features and capabilities of a CMS are first Workflow Management, which includes tools for managing the workflows such as content approval and publication processes. Second Version Control which manages multiple versions of content and tracks changes over time, ensuring that content is up-to-date or accurate. Lastly, User Management which includes tools for managing user permissions, ensuring that users only have access to the content and features they need.

Technical Education and Skills Development Authority (TESDA) is using manual management of training curriculum; they use social media platforms such as Facebook, which can streamline the deployment of available curriculum. For example, if there are available curriculums offered, they post them on the page where the qualifications and procedure are indicated.

TESDA is facing some challenges or issues in terms of training management curriculum, such as accessibility and connectivity issues, which can make it difficult for some learners to access online training courses through the TESDA online programs. Due to limited course offerings, there may still be gaps in certain areas of specialization or courses that are in high demand but not currently available. Researchers propose some technology solutions that could help in addressing these challenges in terms of their training management system. Accessibility and connectivity issues researchers propose the use offline content delivery mechanisms like USB drives. Limited course offerings, to address this challenge, researchers could use data analytics to identify which courses are most in demand and prioritize the development of these courses.

To achieve good and quality education, it is necessary to develop good management, specifically in the field of curriculum that will be taught to students either regarding the objectives, content or teaching materials, implementation and evaluation of curriculum. Without improvement

and implementation of the correct education curriculum in accordance with quality management standards, there is very little possibly of quality improvement in schools. (E. Sabrina et al., 2022)

This study contains the background of the capstone project and issues or problems that researchers would like to give solutions. This also consists of what researchers want to achieve or their objective in conducting the study. In addition, this includes the specific features of the system that would give a solution to the problem to the beneficiaries of the project, the scope and delimitation of the capstone project.

Curriculum Management System with the help of the advancement and innovation of Information Technology. Educators can easily develop, plan and deliver their learning materials online and can be easily access by their students. It also engaged students who lives in very remote places to study at home with ease and not worrying their travel just to go at TESDA Guiguinto branch.

TESDA Guiguinto to branch currently facing some problems regarding issues in terms of Curriculum Management System, such as accessibility and connectivity issues, which can make it difficult for some learners to access online training courses through the TESDA online programs. Due to limited course offerings, there may still be gaps in certain areas of specialization or courses that are in high demand but not currently available.

Curriculum Management System at TESDA Guiguinto branch problems can affect their operations because accessibility and connectivity issues can be crucial to the part of the student affecting their studies resulting to the client or users reporting to the TESDA regarding about the problem. Moreover, addressing these issues can enhance the capability, effectiveness and efficiency of the Curriculum Management System at TESDA Guiguinto branch.

Ultimately, this study can benefit the students of TESDA Guiguinto branch because they can have the access to Curriculum Management System with no issues regarding connectivity and accessibility. The local community of Guiguinto as they can have more skilled workforce or citizen, and TESDA Guiguinto branch as they can provide optimized Curriculum Management System.

Purpose and Description

The purpose of the Curriculum Management System (CMS) for Technical, Education and Skill Development Authority (TESDA) in Guiguinto, Bulacan is to provide information, education and skills about the said programs. The following beneficiaries are:

Regional Training Center Central Luzon – Guiguinto (RTCCL - Guiguinto). With the aim of enhancing vocational education and improving the overall efficiency and effectiveness of curriculum planning, development, delivery, and evaluation processes. The CMS would serve as a technological solution to streamline administrative tasks, facilitate collaboration among stakeholders, and promote continuous improvement in vocational training programs.

Stakeholders. Collaboration and Communication: The CMS would facilitate seamless collaboration and communication among stakeholders, including administrators, instructors, and students. It will feature discussion forums, messaging systems, and virtual classrooms to encourage knowledge sharing, peer interaction, and instructor-student engagement.

Researchers in the Field of Information Technology. The study may serve as a reference for researchers wanting to develop the same system, portal, or application. This would be a tool for researchers to use as they locate trustworthy information that is known to be essential for gaining

a deeper understanding of the topic. They will undoubtedly require this research as their main source of illumination for their upcoming studies.

General Objective

The main objective of the study is to design and develop a Training/Skills Curriculum Management System that will help manage a curriculum and enables educators to design and to deliver high-quality instruction, fosters a personalized and engaging learning experience for students.

Specific Objectives

Specifically, the researchers aim to consider the following objectives:

1. To incorporate the following significant features:

1.1. Course creation

1.2. Archive

1.3 Curriculum file downloadable

1.4 CRUD Operations

1.5 Forum / Discussion tab

2. To test the system using Blackbox Testing

3. To provide analytics report through dashboard

4. To evaluate the system using ISO IEC 25010

4.1 Functional Suitability is the level to which a system or product can fulfill explicit and implicit needs.

4.2 Reliability describes how successfully a system, product, or component carries out specific tasks under specific circumstances.

4.3 Efficiency is the measure of performance in terms of the use of resources.

4.4 Usability is the ability of a product or system to accomplish specific tasks successfully, effectively, and efficiently.

4.5 Security is the degree to which a system or product protects data and information against breaches of security.

4.6 Compatibility refers to how well a product, system, or component ability to share information and carry out its required tasks while utilizing the same hardware or software environment

4.7 Maintainability refers to how well a product or system can be modified to improve, correct, or adapt to changes in the environment as well as requirements.

4.8 Portability refers to how well a system, product, or component can be transferred from one environment to another.

SCOPE AND DELIMITATIONS OF THE STUDY

A training and skills management system is a powerful tool that can provide a range of functionalities to support applicant development and organizational success. One of the key features is the course creation, Archive, Curriculum file downloadable, CRUD Operations, Forum and Discussion tab that allow the TESDA to design and deliver effective training programs tailored to the specific needs of applicants and the organization. Reporting and analytics features can track and measure the effectiveness of training programs, identifying areas for improvement and making data-driven decisions. User management and permissions functionality control access to digital content based on user roles and permissions, ensuring applicants and admins have access to appropriate resources. Content creation allow the creation of training courses, available curriculum, and new courses. Additionally, search functionality enables users to easily find available programs, ensuring that applicants have the knowledge and skills they need to perform their jobs effectively.

Technical issues such as downtime or slow response times can disrupt the system's functionality, leading to frustration and decreased productivity for applicants. Technical difficulties can also lead to data loss, which can impact the accuracy of reporting and analytics features. Once the admin inputs a massive amount of data, the database will possibly shut down because we only use a free web host. In terms of security, the system is vulnerable to hackers because of its weak security. Also, if several people use the website simultaneously, it will become sluggish. The data from the Forum tab cannot be retrieved. Lastly, in the update sector, the researcher can't update the image or pdf that is inserted into the certain program. It is important to consider these limitations when implementing a training/skills management system and to develop strategies to address them to ensure the system's effectiveness and maximize its benefits for employees and the organization.

CHAPTER II

REVIEW OF RELATED LITERATURE AND STUDIES

This chapter consists of related literature and relevant theory that might help the Researchers to have deeper knowledge about the study. This chapter also includes the Conceptual Framework which will discuss in the end section.

Related Literature

This study shows the literature that serves as support of the research project. This section is expected to give researchers have a deeper knowledge about the study that researchers conducted and to understand more what the study is all about, and how this study will help the Client to solve their problem by knowing the gap that found in other study or defined by the literature.

Curriculum Management

Curriculum Management System stores and helps administer curriculum data. It acts as a reference for curriculum topics and as a central store for data pertaining to curriculum topics. It uploads curriculum topics that have been accepted to Curriculum Management System. Additionally, it is crucial for higher education institutions to guarantee that every student gets the most out of every course they enroll in. The use of a curriculum management system can reduce the time and effort required of staff and faculty while simultaneously enhancing the standard of instruction and student performance. Curriculum management has become an important focus in many professional programs. A curriculum management system can be an essential component in today's digital age for enhancing student performance, increasing effectiveness, and maximizing the value of approved content. (Jadhav, 2022)

The processes and procedures required in protecting correct current information regarding curricular offerings are included in curriculum management. Having a solution that allows quick, simple access to all of the programs and resources provided through a single user interface, the curriculum management system saves time. Considering the curriculum management system reduces human labor from numerous processes, it is a cost-effective alternative for schools. Today, curriculum can be automated and simplified for schools to make lectures helpful and interesting. (Shete, 2022)

Curriculum management systems in schools make it easier to organize, administer, and evaluate courses and curricula. Ensure that the aims and educational objectives of the school have been met while offering the best possible student experience. This system offers a central location where curriculum-related data can be kept and accessed. A curriculum management system can save staff and teachers a lot of time and work while also enhancing the standard of instruction and student performance.

According to (Tahereh et., al 2019) a curriculum is the foundation of any educational institution, and the quality of its implementation can be a good indicator of the institution's educational efficacy. To ensure proper curriculum implementation, the curriculum should be managed carefully. There are different definitions for curriculum management; it is sometimes used or called for 'teaching and learning management' or as equal to 'managing the whole institution' There are some other systems termed Learning Management System (LMS) and Learning Content/Curriculum Management System (LCMS). LMS focuses on students' learning process and progression and LCMS has some additional functions related to content and course management. Although the Curriculum Management System (CMS) has some similarities to

LMS or LCMS, it is generally applied in a more extended domain and focuses on the curriculum information required for managerial decision-making. Computers in any CMS are usually used as a repository for curriculum data, which can be searched and retrieved by the system users (administrators, faculty members, students, etc.). The demand seems to be growing for more dynamic systems to deliver timely and automated feedback that can facilitate more efficient curriculum management at different levels.

In the context of TESDA in the Philippines, it is important to have curriculum supervision and (Warman et al, 2021) stated that to assess the effectiveness of educational staff and the efficient utilization of educational resources in order to accomplish educational objectives. The goal of school supervision is to consistently enhance the performance of educational institutions, improve efficiency within these institutions, evaluate the level of achievement of planned activities compared to the actual outcomes, coordinate various tasks or programs being implemented, and establish stronger connections to the organizational goals of schools.

In order to store and manage curriculum data, higher education institutions need to use curriculum management systems. It serves as a central repository for curriculum topics, making sure that each student gets the most out of every course they enroll up for. This system improved the quality of instruction and student performance while requiring less time and effort from staff and educators. In today's digital era and professional programs, curriculum management is an important area of focused since it improves student performance, promotes effectiveness, and maximizes the value of approved content.

Curriculum Management

Curriculum management is the entire process of working together to make it easier for students to complete their learning objectives, with a focus on enhancing the quality of their interactions. Curriculum management places an emphasis on a productivity-oriented curriculum system, where the curriculum is student-oriented and designed to help students meet the goals of learning outcomes. The curriculum is an effort to organize, manage, and manage the content that will be taught in educational institutions as well as provide guidelines for implementing instructional activities in order to meet specific learning objectives. The management of the curriculum is important to the successful and accurate completion of the educational process. To accomplish curriculum objectives, a system of coordinated, comprehensive, systemic, and systematic curriculum management is used (Rusman, 2022). Established national policies are not ignored by the autonomy granted to educational institutions or religious schools in directing the curriculum on their own while giving priority to the needs and accomplishment of goals in their vision and mission statements. Curriculum management, according to (Mulyasa, 2022), is a process that involves developing, implementing, and assessing the curriculum. The organizational features of the curriculum are not specifically defined in the definition, and this perspective only emphasizes three of them. (Nasution, 2023) defines curriculum organization as a pattern or style of how pupils will receive their learning materials. In order to ensure that all educational activities are carried out effectively and efficiently, curriculum management in schools entails planning, implementing, and evaluating activities (Rohit, 2022). The organizing of school resources is a topic addressed in curriculum management in order to carry out activities successfully and efficiently.

The course management is essential for the successful completion of the educational process and involves organized, complete, accurate, and organized approach. It allows educational institutions to direct the curriculum independently, prioritizing the needs and goals in their vision and mission statements. Additionally, it helps to support students in achieving learning objectives, as well as the creation of guidelines for instructional activities in order to achieve particular learning goals.

Interactive Dashboard

Interactive Dashboards were present in this system to have a better viewing and interaction on complex data using visualizations such as charts, tables, maps, or even text typically on a single display. By bringing all-important information in one frame, dashboards enable performance monitoring. (Alhamadi, 2020). By providing information in a simple, clear, and understandable manner, interactive dashboards can help organizations in making data-driven decisions. To save time and effort, they can also assist organizations in identifying problems and initial solutions from within the dashboard. (King, 2022). For instance, dashboards can assist administrators in identifying the most popular courses and updating their course offerings accordingly. (Shacklett, 2022) stated that interactive dashboards are growing in popularity in higher education since they offer a visual representation of data that stakeholders at various levels of the institution can easily understand. (Jaspersoft, 2023) stated that the interactive dashboards help assure alignment between the implemented curriculum, and the accomplished curriculum because they are adaptable, adjustable, real-time, and mobile-friendly.

Using visualizations like charts, tables, maps, or text, interactive dashboards offer a complete perspective of detailed information. It is easier to track performance, make data-driven

decisions, and identify issues. Administrators can use them to determine popular courses and update curricula.

Black Box Testing

Black Box testing was used to determine the functionality, security, and performance of the system, the main focus of the Black Box testing is the available input for an application and the expected outputs for each input value. This testing method is based on software requirement specification and software testing techniques. (Verma et al., 2017). Black box testing is a kind of software testing in which the tester is not aware of how the system internally functions. In other words, the tester is only aware of the system's inputs and expected results. (Murray, 2020) This technique is useful in curriculum management systems as it can immediately find reliability issues, reaction time, and how the system reacts to expected and unexpected user behaviors.

The use of black box testing, an essential part of software testing, is able to ensure that a curriculum management system performs according to expectations and meets the needs of its users.

ISO 25010

ISO 25010 software quality evaluation standards were used to evaluate the software quality of the system, and to determine the acceptability of the developed system. The primary instrument that was used in this study is the questionnaires. The questionnaires, in form of an evaluation sheet shown in Chapter 4, were adopted and properly devised from ISO 25010 standard to capture the respondents' perception regarding the software's quality. The instrument was used in

determining the acceptability of the software in terms of functional suitability, reliability, and suitability (ISO 25000, 2021).

Related Studies and Systems

This section shows all the related studies and system that are relevant to the researchers' project. This will help the researchers to identify what the curriculum management should have, by seeking for the gap or problem from other system.

STREAM Education Curriculum for Primary Thai Language Teachers and School Implementation

According to the Study of (Prommaboon et al, 2022) The goal of the STREAM education curriculum aims to equip learners with the necessary learning skills and knowledge for the future. It underlines the importance the relevant content and effective teaching methods to enhance the student's critical thinking. However, in Thailand, it is important to improve their curriculum and learning management through different but effective educational practices in order to enhance the quality of student learning in the 21st century.

The Pre-development preparation, teacher competency development, mechanisms for teacher competency development, and measurement and evaluation of teacher competency are STREAM education's four components. It is essential for teachers to understand and apply this concept in their own teaching practices and method. The curriculum has already been evaluated by experts in terms of its functionality, feasibility, suitability, and accuracy, and the result has been found to be of high quality overall, ready for implementation in classrooms by teachers.

Technical Education and Skills Development Authority (TESDA) aim to provide learners with the knowledge and abilities they will need in the future, putting an emphasis on effective teaching methods to enhance their critical thinking. To ensure the quality of student learning in the 21st century, TESDA must focus on improving its curriculum management system and a variety of effective teaching strategies. TESDA should prioritize pre-development preparation, trainer competency development, mechanisms for trainers' competency development, and measurement and evaluation of trainers' competency as the four essential components of STREAM education. Trainors in TESDA Guiginto need to understand and apply these concepts in their own teaching practices, because the curriculum has already undergone evaluation by experts, assessing its functionality, feasibility, suitability, and accuracy, and has been deemed of high quality overall, making it ready for implementation in classrooms by teachers.

Building a Database for Curriculum Mapping and Analytics [version 2]

The study of (Kang YB et al, 2019) aims to explore and analyze the implementation of user segregation in the IMU, providing insights into how various user categories are defined and managed. By examining the distinct user roles within the system, we come up into three key categories: admin users, curricula manager users, and non-editing users. Each category holds unique permissions and access levels, contributing to a comprehensive and inclusive user experience. This research seeks to enlighten the significance of user segregation and its impact on the IMU ecosystem, highlighting the seamless navigation, control, and convenience it offers to administrators, curricula managers, and the broader community of non-editing users, including students and faculty.

The database's structure plays a vital role in its functionality, especially in relation to search, analysis, report generation, and graphical analysis. For TESDA in the Philippines, it is

crucial to make informed decisions about the database structure to ensure seamless operations. To achieve this, it is recommended to involve skilled personnel experienced in developing database structures as part of the team responsible for developing the database structure and the entity relationship diagram (ERD).

Faculty and staff involvement: In the context of Technical Education and Skills Development Authority (TESDA) in the Philippines, ensuring the active participation of faculty and staff is important for maintaining an up-to-date curriculum. Similar to a curriculum map, which requires periodic updates to reflect the current state of the curriculum, this poses challenges for both faculty members and the curriculum administrator. To address this issue, one possible solution is to provide pre-designed templates in Word or Excel format, containing the necessary curriculum details. These templates can facilitate the automatic import of information into the database, streamlining the updating process. To ensure the currency of the curriculum data, the database can track four specific fields that identify the person responsible for data entry, the person who modifies the data, and the timestamps of modifications. Additionally, a log file can be implemented to maintain a comprehensive history of changes made to the curriculum, providing further transparency and accountability. By encouraging faculty and staff buy-in through streamlined processes and comprehensive tracking mechanisms, TESDA can effectively manage and maintain an accurate and current curriculum database.

Content Analysis of Curriculum Development Related Studies During: 2000 – 2019

The study of (Jawabreh & Gündüz, 2021) stated that it is important to understand who are the individuals involved in the curriculum development, because, curriculum developers should possess the necessary knowledge and expertise to effectively plan, implement, and evaluate the curriculum. Additionally, TESDA trainer's themselves act as curriculum developers when they

plan their classes, as they contribute to the development of the curriculum. Therefore, curriculum development is a collaborative effort that requires the involvement of various individuals, including students, TESDA trainers, and the community, as valuable sources for curriculum development.

When it comes to curriculum development, discussions often focus on teaching strategies, methods, and needs assessment, while designing, planning, and monitoring receive less attention. This indicates that research topics in this area share similarities but may not complement each other effectively.

Conceptual Framework

This section shows the input, process, and output that are presented to evaluate the composition of the capstone project. The figure of Conceptual Framework shows the input and the process that researchers need to accomplish to get the expected output which is the Training Skills Management Curriculum.

The figure below show the Conceptual Framework of the study.

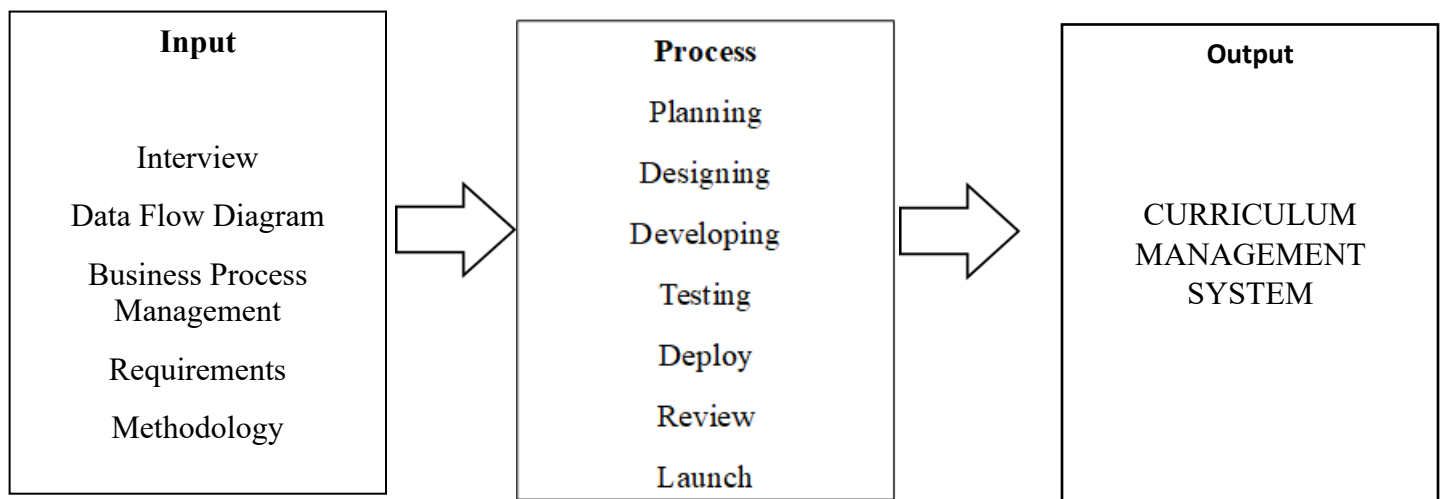

Figure 1. Schematic Diagram of the Conceptual Model of the Study

The researchers need to conduct interview in order to know the possible data flow diagram that may use to work with the system, also by conducting interview the researchers know what would be the possible requirements and methodology that can be used in the whole study. After the conducting interview, the researchers should follow all the process that researchers use in the whole making of system in order to accomplish the expected system.

CHAPTER III

TECHNICAL BACKGROUND

This chapter presents the methodology to be used both for the development of the analytics model and the development of a system that would optimize the functions of the model. This section also presents the requirement analysis of the study. Project architecture and other relevant diagrams are also included to illustrate the system design and process involved in the project. The last part describes the testing methods to ensure the integrity and validity of the model.

Methodology for Analytics Modeling

The Curriculum Management System is an essential tool that enables educators to track and manage their curriculum's effectiveness and popularity among students. To achieve this goal, the system utilizes a range of data analysis techniques, including descriptive analysis, which is particularly useful for providing insights into historical data.

Descriptive analysis involves the systematic and comprehensive evaluation of the performance of individual components of the curriculum. By examining data on the difficulty and discriminatory power of each item, educators can identify any problematic areas and make informed decisions on whether to revise, retain, or eliminate them.

One of the primary benefits of using descriptive analysis in the Curriculum Management System is the ability to measure the curriculum's effectiveness over time. By examining historical data, educators can determine whether the curriculum has been successful in meeting its objectives,

and how it has evolved over time. They can also identify any areas that require improvement and adjust the curriculum accordingly to ensure its continued success.

Another benefit of descriptive analysis is its ability to measure the popularity of the curriculum among students. By examining data on student engagement and participation, educators can gain insights into which components of the curriculum are most effective and popular. They can then adjust the curriculum to ensure that it continues to engage and inspire students, improving their learning outcomes.

In conclusion, descriptive analysis is a powerful tool for the Training/Skill Curriculum Management System. By providing insights into the effectiveness and popularity of the curriculum, it enables educators to make informed decisions that enhance the learning outcomes of their students.

Methodology for System Development

The activities required to facilitate and complete software development are defined and organized by the SDLC. Development teams employ the approach to produce digital goods with a tolerable degree of bugs, within the intended time frame, and using the specified resources. It's a type of optimization approach that divides the big company goal into smaller, doable goals to get to the result.

Researchers decided to use Agile Scrum Methodology as a sprint-based project management system with the goal of delivering the highest value to stakeholders. Companies of all sizes used it for its ability to provide high-end collaboration and efficiency for project-based work. Agile and scrum are two different methods and can be used separately. However, their combined benefits make the agile scrum methodology the most popular use of agile.

Agile framework is a specific approach to planning, managing, and executing work. Agile frameworks typically fall into two categories: Frameworks designed for teams, and frameworks designed to help organizations practice Agile at a scale, across many teams. While Scrum is precisely an evolution of Agile Management. Scrum methodology is based on a set of very defined practices and roles that must be involved during the software development process. (Berman, 2022)

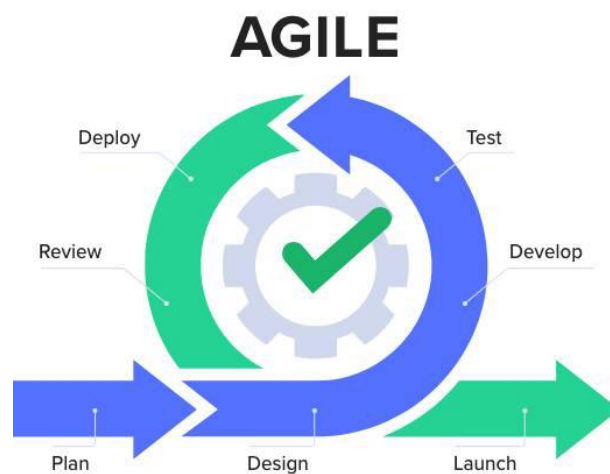

Figure 2. Agile Scrum Methodology

Retrieved from: <https://www.cybermedian.com/the-relevance-of-uml-in-agile-software-development/>

*Phase 1. **Plan.*** Before beginning projects, researchers studied the organization's structure and background. Researchers must know the ultimate result, the value to the organization or client, and the process to accomplish the same.

*Phase 2. **Design.*** Researchers propose interface of the system and how does the requirements will help to build the system.

*Phase 3. **Develop.*** After planning, the Researchers can start the first iteration of the software. Development phase includes all relevant production tasks in the SDLC, such as UX/UI design, architecting, and coding.

*Phase 4. **Test.*** Researchers check and address the defect, fault or bugs, and will perform testing up to acceptance testing unit.

*Phase 5. **Deploy.*** Once the website is ready to be released, the Researchers will deploy it to the end-user or install it to the Client's system.

*Phase 6. **Review.*** Asking for feedback from the Client, Adviser, and Panelist to prevent defects, to identify, and to resolve the issue that may arise or may appear in the system code during deployment.

*Phase 7. **Launch.*** When the system meets all the requirements and there's no revision or no defects that can be found in the system, the TESDA and Applicant can use the system that Researchers or Developer made for Training or Skill Management Curriculum.

Requirements Analysis

This section is consisting of different requirements that system should be met, the User Requirements, Functional and Non-Functional Requirements, and System Requirements

The Training or Skill Management Curriculum System will provide an overview of the curriculum, the qualifications, and such. The System's objective is to capture the attention of every applicant, whether new or old, and encourage them to enroll in a specific program or curriculum. To make the system's objective possible, there are different Requirements that should be met.

Functional Requirements

CRUD Operation. The system should be able to perform CRUD Operation so the TESDA employee who use the system can add, retrieve, update, or delete programs, subject or curriculum. The Applicant can be able to read or view the programs, subject or curriculum that TESDA employee input to the system.

Report. The system should be able generate analytics report by counting all the numbers of Applicants who download a specific curriculum or program.

Non-functional.

Functional Suitability. It is an important factor since it implies that a software product satisfies the needs and requirements of its users. Users can then rest easy knowing that the products they acquire are complete and correct functionally.

Maintainability. This characteristic indicates how simply and effectively a product or system can be updated and modified, which is crucial for keeping the system current with changing environments and requirements.

Portability. It is an essential factor by which a system, product, or component can be transferred from one operational or usage environment to another.

Usability. The system usability will determine if the system is easy to learn, efficient to use, or if the user feels satisfied when using the system.

Availability. The system should make the data or information available to the user either TESDA or Applicant.

Reliability. The system should be reliable by performing accurately and smoothly without the user experiencing some system failure.

Security. The system should be able protect all the information that Client will input to the system and the user or client credentials when they login their account to the administration side of the system.

System Requirements

Network. The system required a network to function because it is an online based website which cannot run without internet connection.

Web browser. The system recommended to use updated or latest version of web browser such as google chrome or Microsoft edge.

Operating System. The web browser should be compatible with the operating system which is Microsoft Windows OS and Linux.

Design of Software, Systems, Product and/or Processes

This part includes all the necessary diagrams that are needed for the development of the project. Includes here the Data Flow Diagram and Entity Relationship Diagram to understand more about the project.

Data Flow Diagram

Figure 2 shows the Data Flow Diagram of the system.

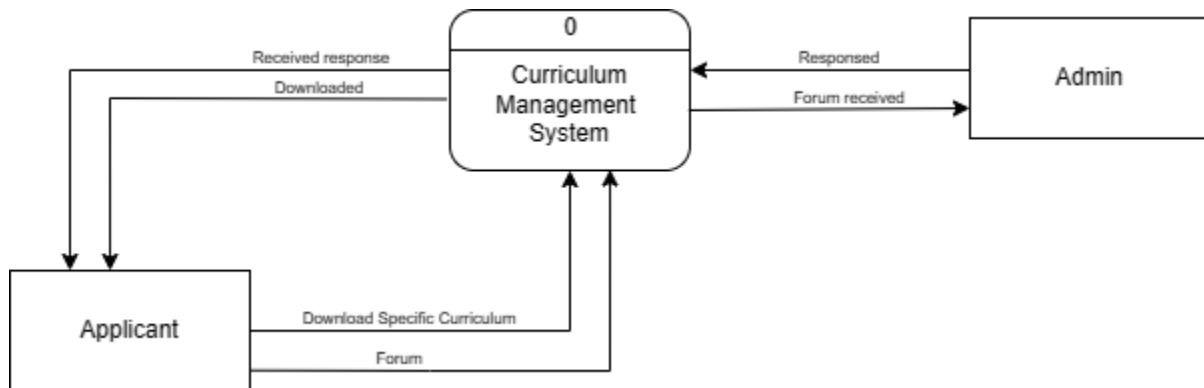

Figure 3. Data Flow Diagram Level 0

The figure above shows a data flow diagram that represents the flow of information between an Admin, Applicant and the Curriculum Management System.

The figure below shows the Level 1 Data Flow Diagram of the System.

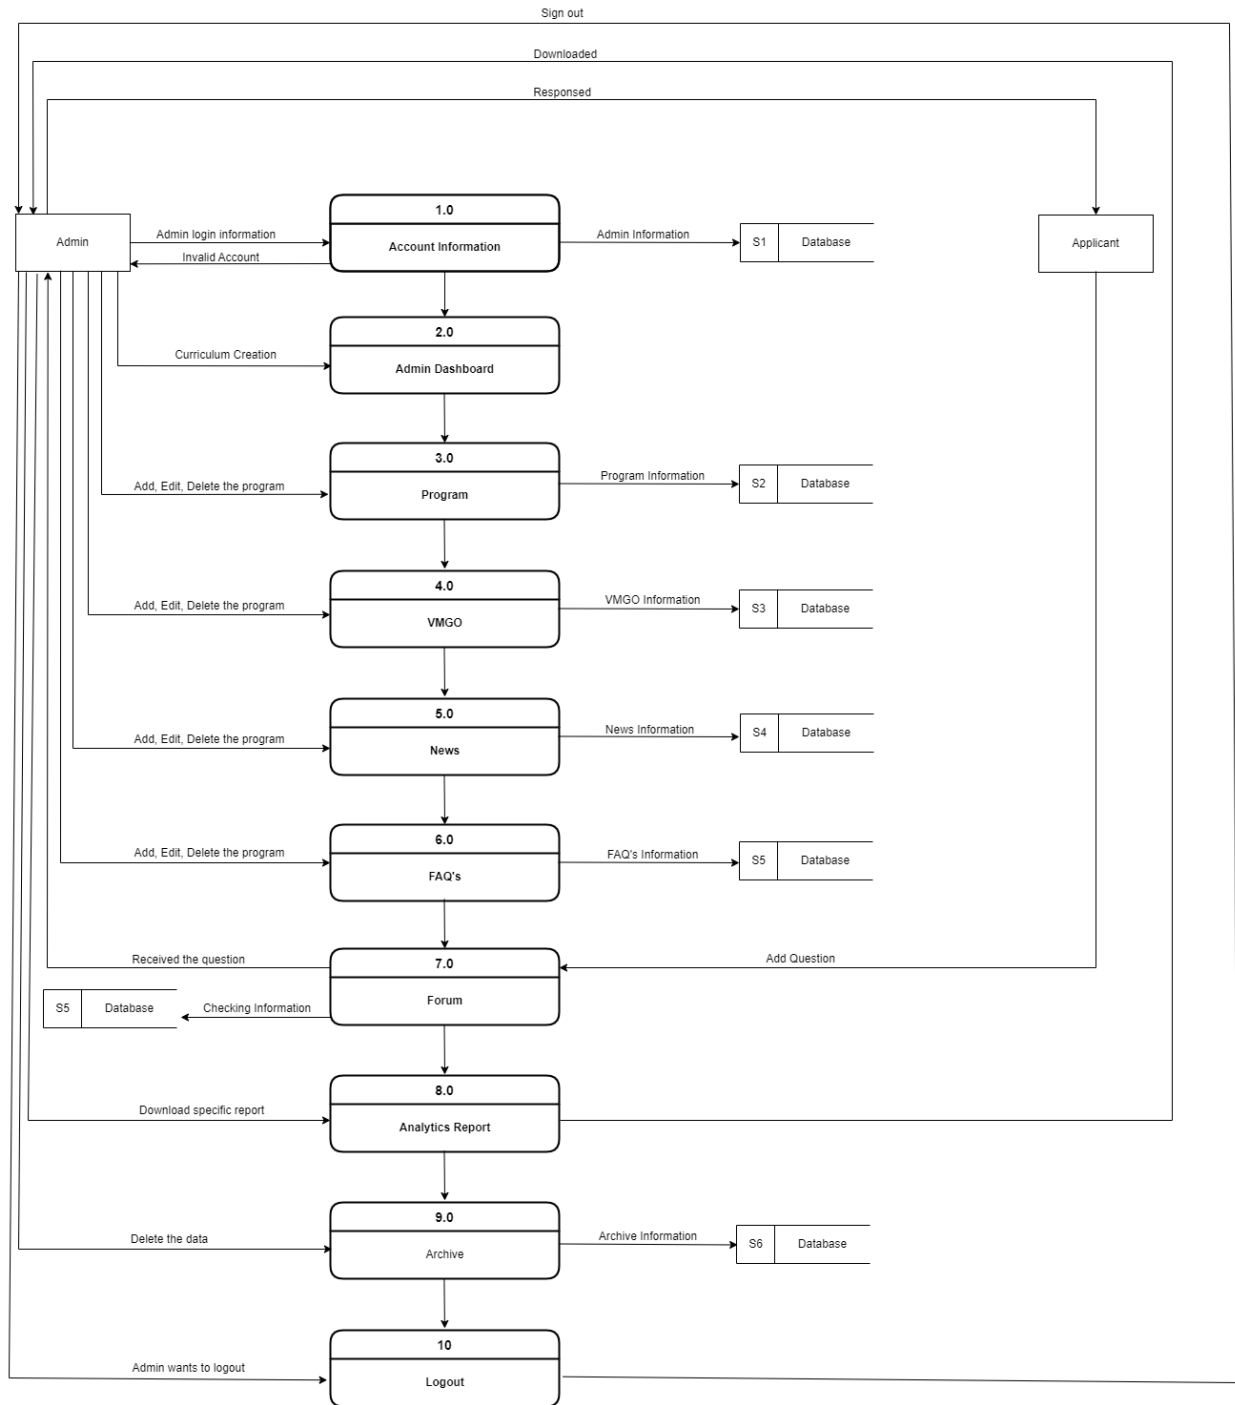

Figure 4. Data Flow Diagram Level 1

The figure above shows how Admin logs in to the system, the system checks the Admin credentials to see if they are valid or invalid in the database, and if they are valid, the Admin proceeds to the dashboard and accessing the system.

The figure below shows the Entity Relationship Diagram

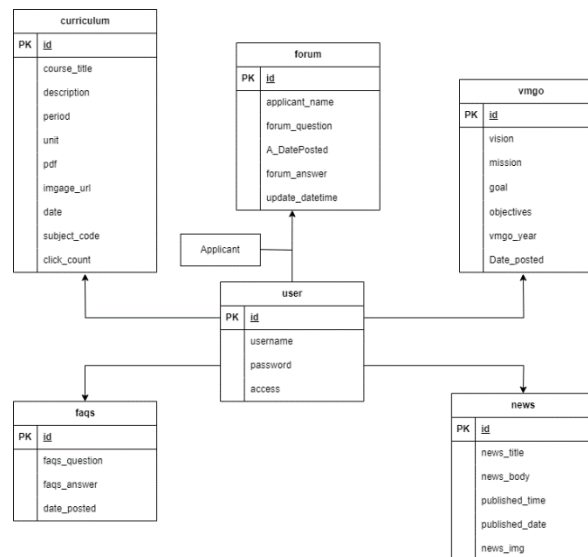

Figure 5. Entity Relationship Diagram

The figure above shows how to link the login for an employee and the employee's role. At that time, employees will log on to the system to know who is on duty at that time and what their roles are.

Description of the Prototype

Training/Skill Management Curriculum System. Web-based system that help the TESDA to spread information about the curriculum they offer. The system also allows TESDA to manage the curriculum by performing CRUD operation or Create, Read/Retrieve, Update, and

Delete. The system can also generate analytics report to see how many applicants download the specific curriculum, since Applicant can view and download all the curriculum information that TESDA created or update in the system.

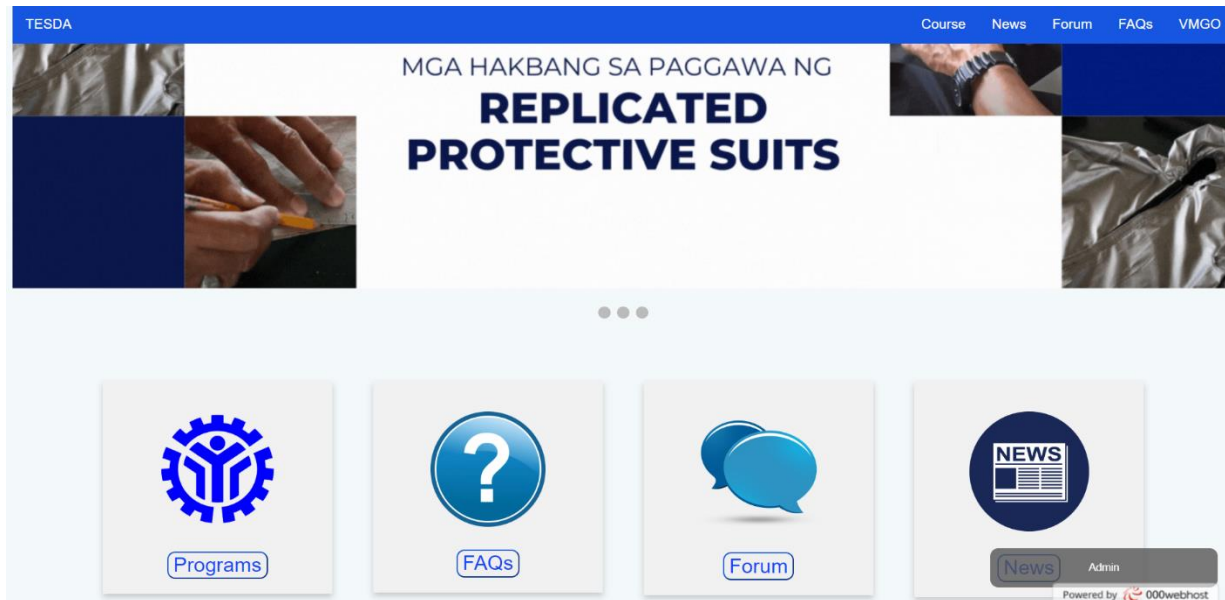

Figure 5. Home Page

The figure above shows the home page of the Curriculum Management System wherein the Applicant can click those button that shows in the figure, and if the applicant click those button, then the user will be direct to different pages.

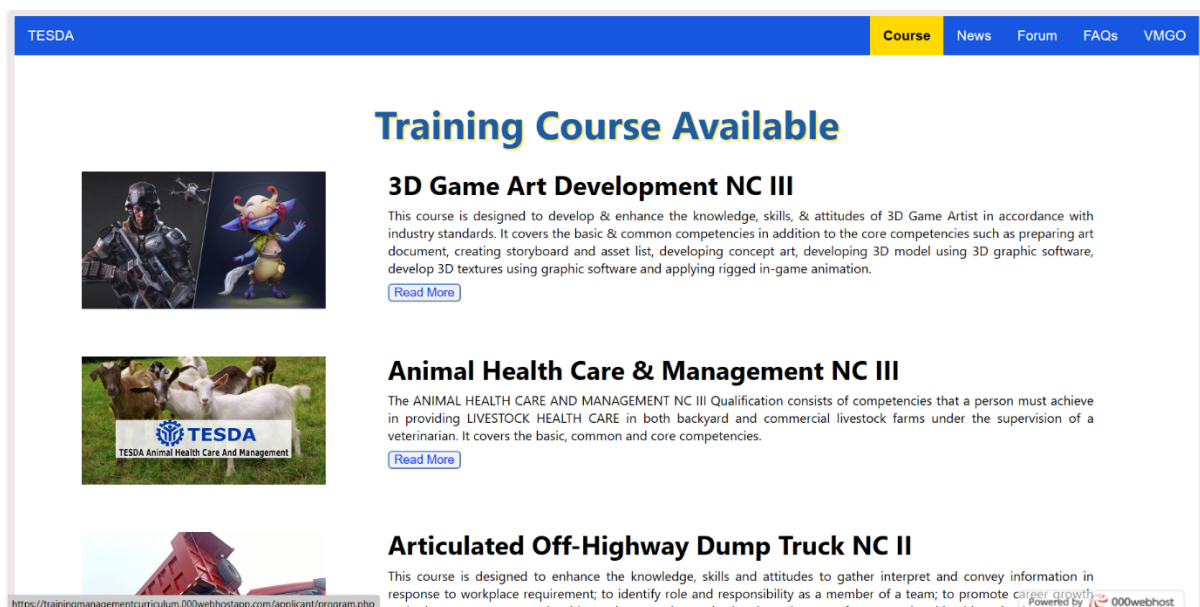

Figure 6. Course

The figure above shows the list of Courses that TESDA offer. Once the Applicant click the read more button it will direct to the Curriculum Information Page where the Applicant can understand more what is the course all about.

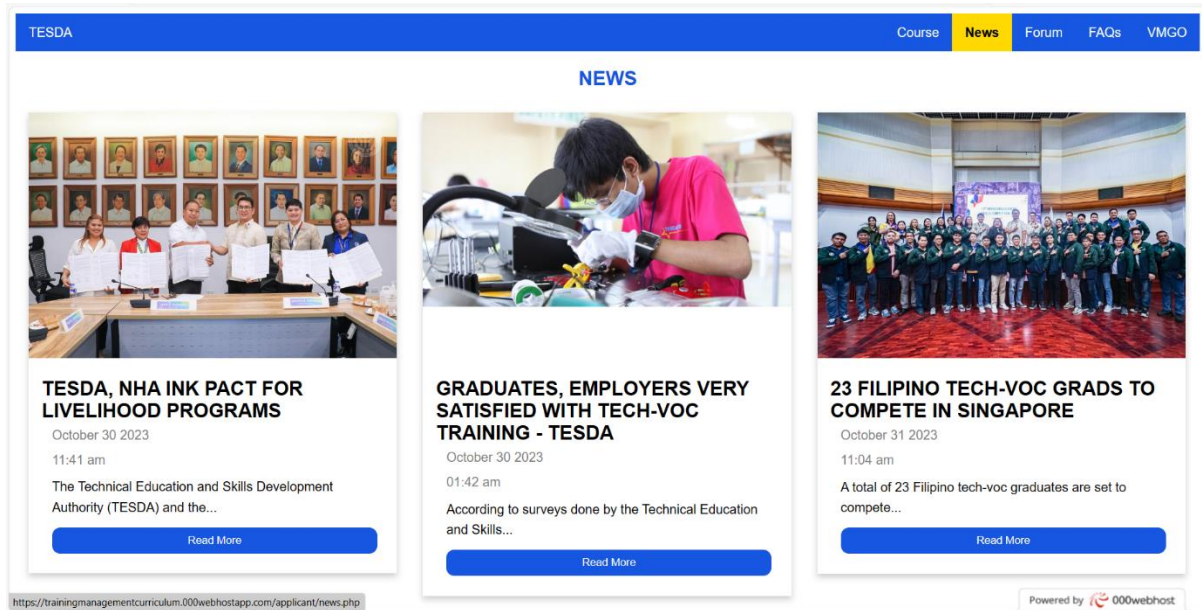

Figure 7. News

The figure above shows the News Page where the Applicant can read all current events or new announcement from TESDA.

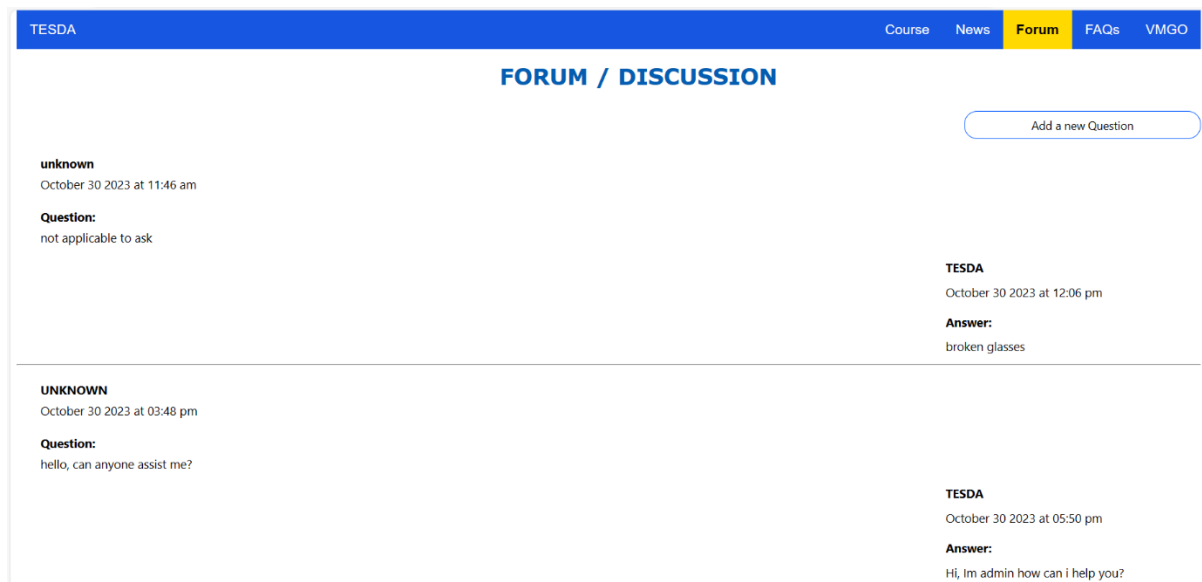

Figure 8. Forum

The figure above shows the Forum Page where Applicant and Admin can use to communicate with each other.

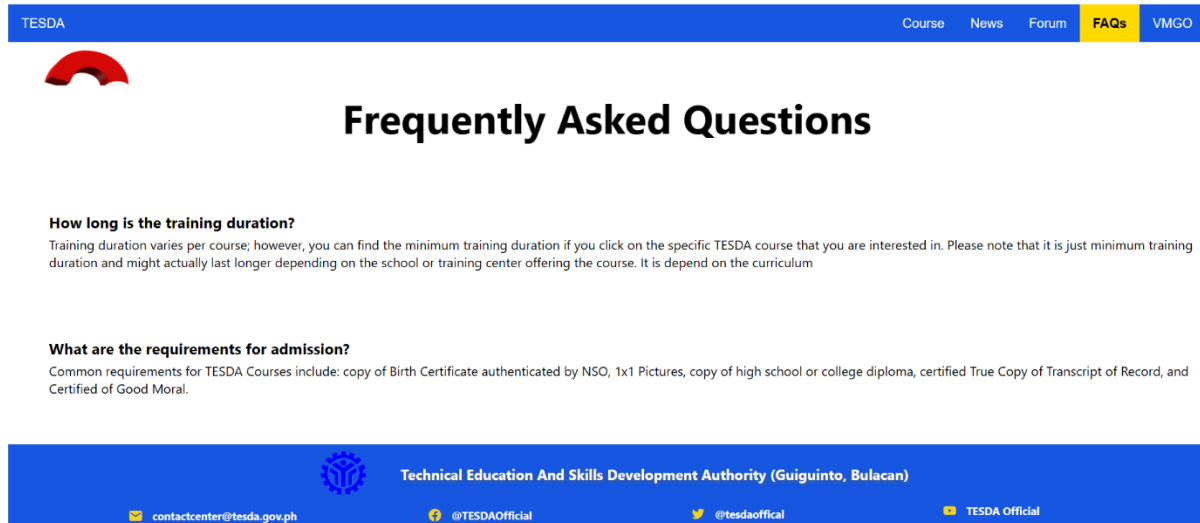

Figure 9. FAQs

The figure above shows the FAQs Page where the Applicant can read all the answer from Frequently Asked Questions.

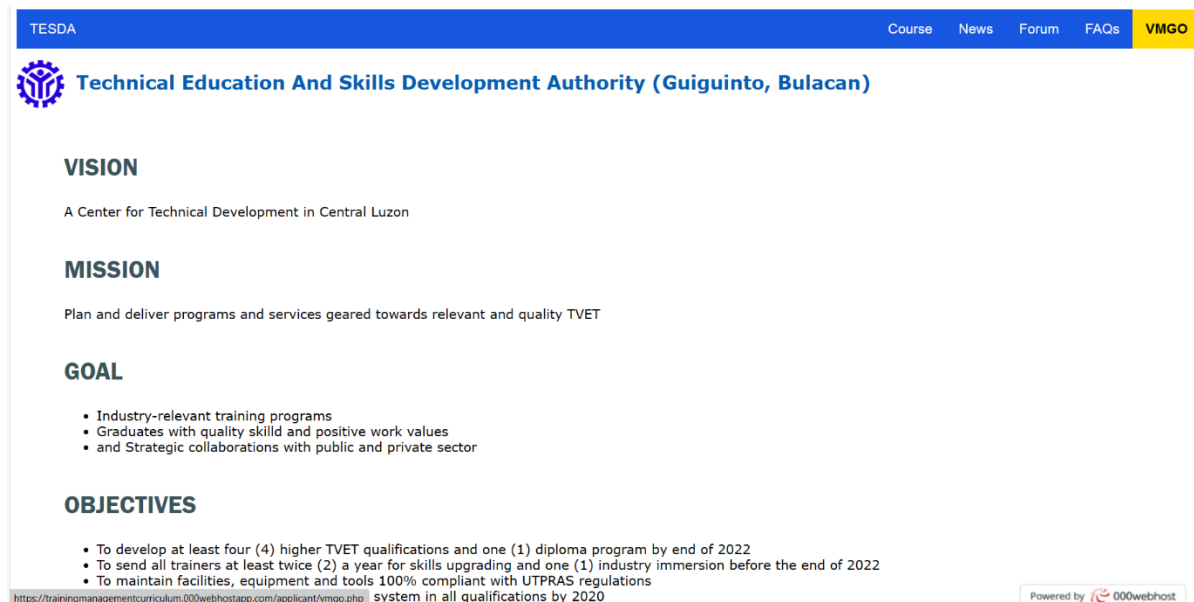

Figure 10. VMGO

The figure above shows the VMGO page where the Applicant can read or view the VMGO of TESDA.

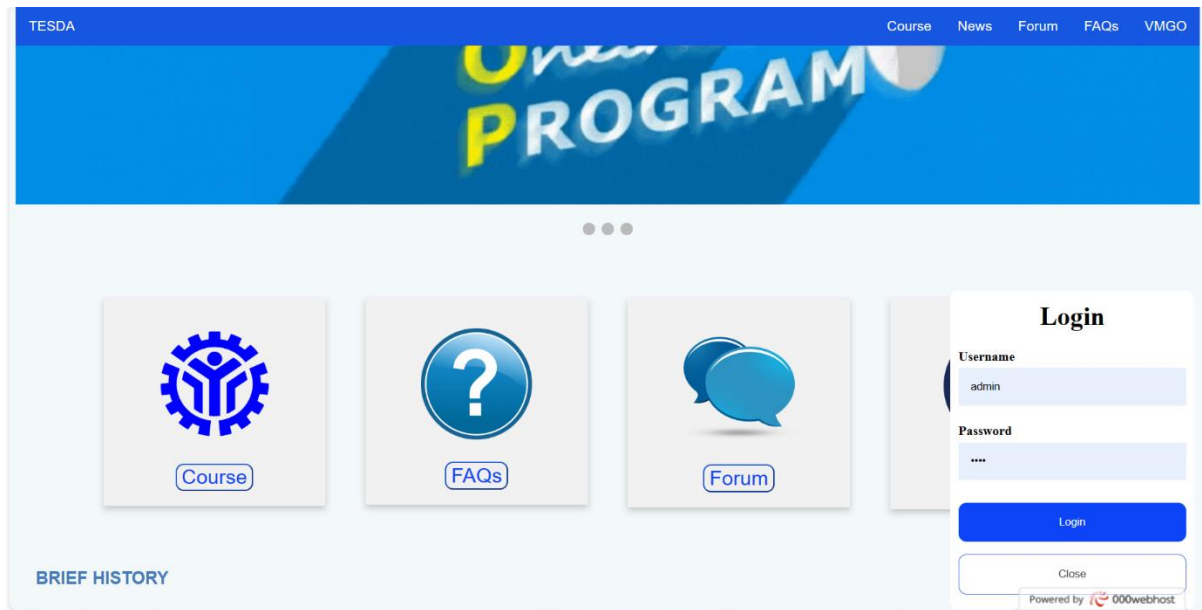

Figure 11. Admin Login

The figure above shows the home page of the Applicant wherein there's a button below that an Admin can input their credentials to have an access to the Admin Page.

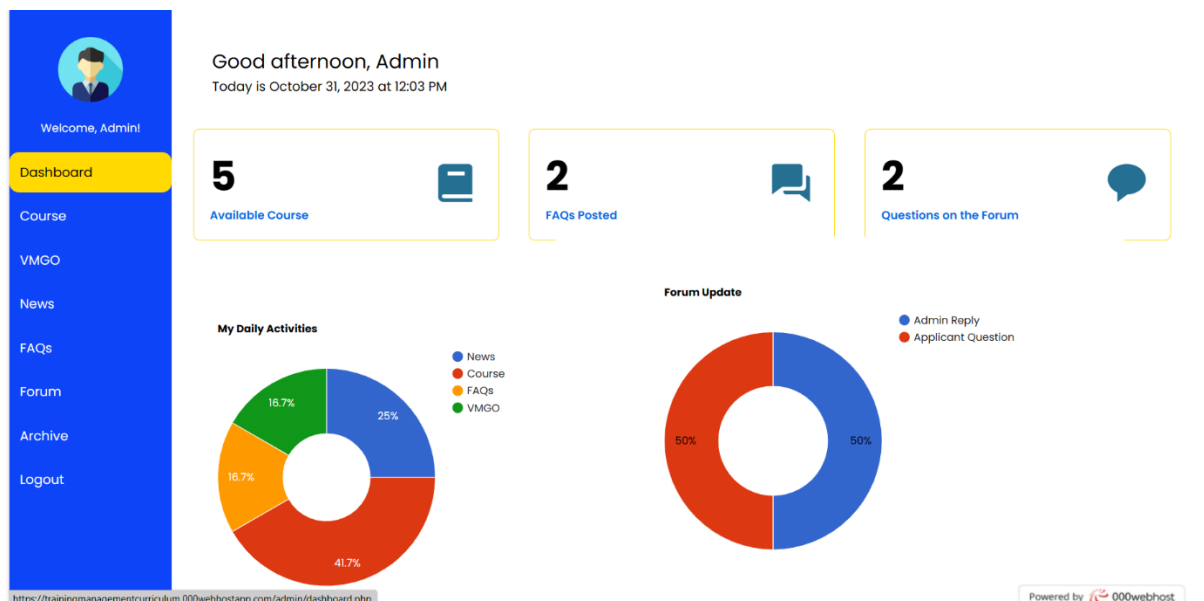

Figure 12. Admin Dashboard

The figure above shows the Admin Dashboard where Admin can monitor the daily operations or activities of the system.

The figure above shows the Archive Page where all the deleted data or information in the systems is located in this page.

Testing

Black box testing involves testing a system with no prior knowledge of its internal workings. A tester inputs data and monitors the output produced by the system being tested. This allows for the identification of the system's response time, usability challenges, and reliability concerns as well as how the system reacts to expected and unexpected user activities. Since it tests a system from beginning to end, black box testing is an effective testing method. A tester can imitate user action to check whether the system fulfills its functions, much as end users "don't care" how a system is programmed or designed and expect to get an appropriate response to their requirements. A black box test assesses every relevant component along the path, including the UI/UX, database, dependencies, and integrated systems, as well as the web server or application server. (Imperva, 2023)

ISO/IEC 25010 identifies the qualities to take into account when judging a digital product. Mode enumerates the characteristics of a high-quality, satisfactory product to be ensured prior to this product's distribution, or even sometimes to review the software that has already been launched (Zingerone, 2023). Because it offers a standard language and framework for assessing and enhancing software quality, ISO/IEC 25010 is important. It aids in the identification and prioritization of the quality standards and needs for the software systems and products being developed by stakeholders and developers. Additionally, it helps consumers and users in comparing and choosing software systems and products based on their quality features and sub-aspects.

Table 1. Questionnaire for the System Evaluation taken from ISO 25010

Indicators	5	4	3	2	1
Functional Suitability					
1. The system is easy to use					
2. I can easily download the data (e.g. course materials) from the system.					
3. It provides initial course outline or syllabus.					
4. It provides brief overview of the course.					
5. It is easy to create and add a new curriculum to the system					
6. I am able to delete or remove curricula when they were no longer needed.					
Efficiency					
1. It is easy to navigate.					
2. The system offers a user-friendly interface.					
3. The information is presented clearly.					
4. The system facilitates collaboration and communication among different users.					
5. The system can generate analytics report using historical data.					
6. The system has mechanism for collecting users suggestions of improvement.					
Usability					
1. The process for entering and updating curriculum data is use-friendly.					
2. Without much effort I can use the system.					
Reliability					
1. Errors can be controlled by the system					
Security					
1. Each users have their own password.					
2. Security features covers System Access.					
3. System facilitates recovery procedures.					
Maintainability					
1. Modification of system is not difficult.					
2. Diagnosis of errors are easily done by system.					
3. System unable to function well after modification.					
4. System can be simply put to a test.					
5. After change in system, it can continue functioning.					
Portability					
1. The System can progress to different environment.					
2. The System can go along with portability.					

Table 1 shows the entire list of indicators that were used to assess the system, and there are three types of respondents that researchers have, IT Students and IT Experts. The total number of respondents from IT Students are one hundred (100), the total number of respondents from IT Experts are five (5), and the Client which is the TESDA. The System demonstration and evaluation was conducted through video that was saved from google drive and survey, and the system evaluation was focused on the functions of different features of the system. To understand the respondent's perspective about the system, the data that had been collected were organize, analyzed, and interpreted through solving the mean value of each score.

Table 2. Reference Value in Obtaining Mean Value Score

Weighted Scores	Descriptive Rating
4.3 – 5.0	Excellent
3.5 – 4.2	Very Good
2.7 – 3.4	Good
1.9 – 2.6	Fair
1.0 – 1.8	Poor

The Table 2 shows the reference value to obtain the mean value score through five (5) points Likert Scale. The table has two columns, the descriptive rating and the weighted scores, wherein the 4.3 to 5.0 is the Highest or the Excellent and 1.0 to 1.8 is the lowest or the Poor in descriptive rating. The ratings of the answers were computed by adding all the respondents per number and divide the answer to the number of respondents.

CHAPTER IV

RESULTS AND DISCUSSION

In this chapter the researchers discuss the findings of the study based on the outcomes of the specific objectives mentioned in Chapter I. It aims to present an analysis of the results obtained and their significance, within the context of the study. Additionally, the researchers explore how data was represented treated statistically and analyzed as part of this study. This section aims to provide a summary report of the research outcomes while also addressing any objectives that were not fully met and offering suggestions for improvements.

Research Question # 1: To incorporate the following significant features such as the Course creation, Archive, Curriculum file downloadable, CRUD Operations and Forum / Discussion tab.

To realize the first objective of the study, which is to *“To incorporate the following significant features such as the Course creation, Archive, Curriculum file downloadable, CRUD Operations and Forum / Discussion tab”* the researcher performed PHP, HTML, JavaScript, CSS and MySQL. This curriculum management system can be access by applicants and the admin of TESDA.

The figures below show the glimpse of the following significant feature of the system: Course Creation, Archive, Curriculum file downloadable, CRUD Operations and Forum / Discussion tab

Add New Course

Course Title and NC Level

Unit Duration

Description

Course Cover Picture No file chosen

Course Curriculum File No file chosen

Figure 19. Course Creation

As shown in the Figure 19, this is the Course Creation of the Curriculum Management System wherein the admin can create a new Course that will display on the applicant webpage.

Figure 20. Archive

As shown in the Figure 20, Archive is the secondary storage of the system that also connected to system. It enables to. The admin can retrieve and permanently delete the data from archive.

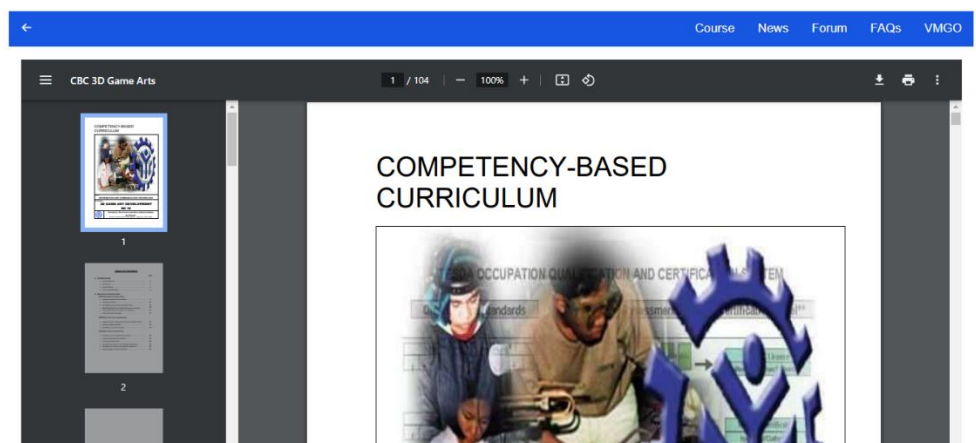

Figure 21. Curriculum File Downloadable

As shown in the Figure 21, the system has Curriculum File Downloadable feature wherein the TESDA Applicant can download the Curriculum File of the specific course.

A screenshot of a web application interface for adding a new course. On the left is a blue sidebar with a user profile icon and the text 'Welcome, Admin!'. Below this are navigation links: 'Dashboard', 'Course' (highlighted in yellow), 'VMGO', 'News', 'FAQs', 'Forum', 'Archive', and 'Logout'. The main content area is titled 'Add New Course' in blue. It contains several form fields: 'Course Title and NC Level' (a single-line text input), 'Unit' (a single-line text input), 'Duration' (a single-line text input), and 'Description' (a large multi-line text area). Below these are two file upload sections: 'Course Cover Picture' and 'Course Curriculum File'. Each section has a blue 'Choose File' button and the text 'No file chosen'. At the bottom right of the form are two buttons: 'Submit' (blue) and 'Cancel' (red).

Course Title and NC Level
3D Game Art Development NC III

Unit
21

Duration
1,000 hours

Description
This course is designed to develop & enhance the knowledge, skills, & attitudes of 3D Game Artist in accordance with industry standards. It covers the basic & common competencies in addition to the core competencies such as preparing art document, creating storyboard and asset list, developing concept art, developing 3D model using 3D graphic software, develop 3D textures using graphic software and applying rigged in-game animation.

Figure 22.3 CRUD Operations

As shown in Figure 22, this is one of the features of the system wherein the Admin can add new course. Figure 22.1 shown the edit course and the figure 22.2 is the example description of program course available. Last figure 22.3 is the CRUD Operations that allow admin to Create, Read or View, Update, and Delete anything from the system.

Figure 23. Forum/Discussion Tab

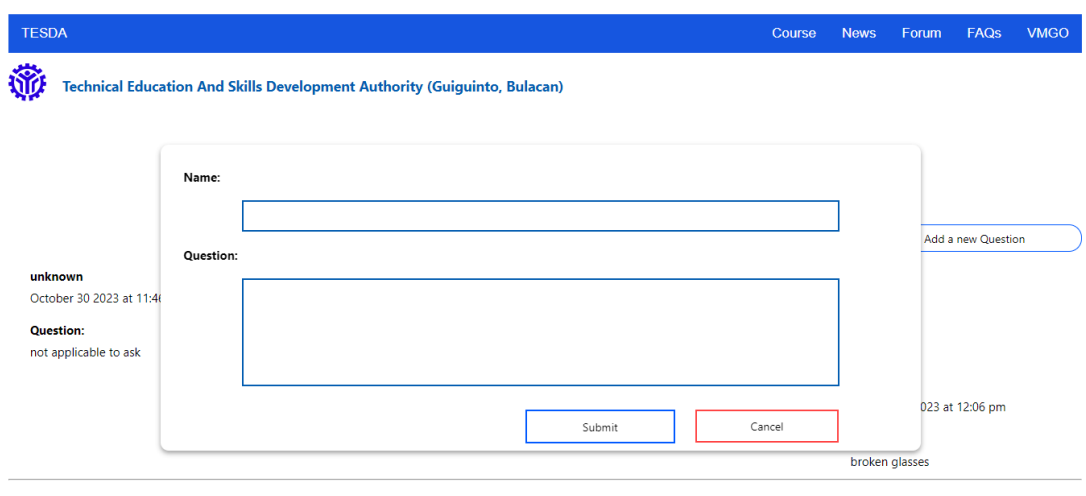

Figure 23.1 Forum/Discussion Tab

As shown in Figure 23, this is the Forum/Discussion Tab feature of the system wherein the Applicant can ask any queries about TESDA Course or the Curriculum. Figure 23.1 shown above is the forum tab for admin that will answer the question based on the admin working hours.

Research Question # 2: To evaluate the features the system using Blackbox Testing.

Blackbox Testing is used in this study since it is a powerful testing technique that exercises a system end-to-end considering the system is being tested of the tester does not aware of how the system internally functions. It is useful in curriculum management systems as it can immediately find reliability issues, reaction time, and how the system reacts to expected and unexpected user behaviors.

Research Question # 3: To provide analytics report through dashboard

To accomplish the third objective of the study, which is to “*To provide analytics report through dashboard*” the researchers performed different languages such as PHP, HTML, JavaScript, CSS and MySQL.

The figure below shows the Dashboard that contains of Analytics Report

Figure 24. Dashboard

As shown in Figure 24, this is the Dashboard of the system where the analytics report can be seen. All the activity that made by Admin will show on the Dashboard, and even the number of

question that applicant added on the Forum/Discussion Tab. It also allows the admin to monitor how many Course that has been created and how many applicants download the curriculum of the specific course.

Research Questions # 4: To evaluate the system using ISO IEC 25010

This section presents the result of the evaluation strategy and the interpretation of the acceptability of the developed software in terms of the following quality factors: 1) Functional Suitability; 2) Reliability; 3) Efficiency; 4) Usability; 5) Security; 6) Maintainability; 7) Portability.

The developed system was evaluated by two groups of respondents to determine the level of its acceptability. The first group are IT professional, second group are the students of College of Information and Communications Technology (CICT), and lastly, the Client which is the TESDA

Table 3. Mean Distribution and Description of the Functionality of the System Evaluated by IT Students

Functional Suitability	Weighted Mean	Interpretation
1. The system is easy to use	4.4	Excellent
2. I can easily download the data (e.g. course materials) from the system.	4.32	Excellent
3. It provides initial course outline or syllabus.	4.37	Excellent
4. It provides brief overview of the course.	4.46	Excellent
5. It is easy to create and add a new curriculum to the system	4.4	Excellent

6. I am able to delete or remove curricula when they were no longer needed.	4.35	Excellent
Average Weighted Mean	4.38	Excellent

As shown in Table 1, the system is rated as “Excellent” with the average weighted mean of 4.38 in terms of functionality of the system. Question number 4 achieved the highest mean among six questions, which means the system provides a brief overview of the course. Based on the findings, the system gives accurate and precise outcomes. Additionally, the system allows the users to carry out specific task and goals.

Table 4. Mean Distribution and Description of the Efficiency of the System Evaluated by IT Students

Efficiency	Weighted Mean	Interpretation
1. It is easy to navigate.	4.36	Excellent
2. The system offers a user-friendly interface.	4.39	Excellent
3. The information is presented clearly.	4.49	Excellent
4. The system facilitates collaboration and communication among different users.	4.32	Excellent

5. The system can generate analytics report using historical data.	4.36	Excellent
6. The system has mechanism for collecting users suggestions of improvement.	4.41	Excellent
Average Weighted Mean	4.39	Excellent

As shown in Table 2, the system is rated as “Excellent” with the average weighted mean of 4.39 in terms of efficiency of the system. Question number three achieved the highest mean among six questions, which means the information is presented clearly on the system. Based on the findings, the system gives accurate and precise outcomes. Additionally, the system allows the users to carry out specific task and goals.

Table 5. Mean Distribution and Description of the Usability of the System Evaluated by the IT Students

Usability	Weighted Mean	Interpretation
1. The process for entering and updating curriculum data is use-friendly.	4.38	Excellent
2. Without much effort I can use the system.	4.37	Excellent
Average Weighted Mean	4.38	Excellent

As shown in Table 3, the system is rated as “Excellent” with the average weighted mean of 4.38 in terms of Usability of the system. Question number one achieved the highest mean among the other question, which means the process for entering and updating curriculum data is use-friendly. Based on the findings, the system gives accurate and precise outcomes. Additionally, the system allows the users to carry out specific task and goals.

Table 6. Mean Distribution and Description of the Reliability of the System evaluated by IT Students

Reliability	Weighted Mean	Interpretation
1. Errors can be controlled by the system.	4. 21	Very Good
Average Weighted Mean	4.21	Very Good

As shown in Table 4, the system is rated as “Very Good” with the average weighted mean of 4.21 in terms of Reliability of the system. There is one question for the Reliability, and the question achieved 4.21 mean, which means the system can control the error. Based on the findings, the error is under of control by the system. Additionally, the system allows the users to carry out specific task and goals.

Table 7. Mean Distribution and Description of the Security of the System evaluated by IT Students

Security	Weighted Mean	Interpretation
1. Each users have their own password.	4.56	Excellent
2. Security features covers System Access.	4.4	Excellent
3. System facilitates recovery procedures.	4.44	Excellent

Average Weighted Mean	4.47	Excellent
------------------------------	-------------	------------------

As shown in Table 5, the system is rated as “Excellent” with the average weighted mean of 4.47 in terms of Security of the system. Question number one achieved the highest mean among the three questions, which means the system allows each user to have different password to make the account more secure. Based on the findings, the system gives accurate and precise outcomes. Additionally, the system allows the users to carry out specific task and goals.

Table 8. Mean Distribution and Description of the Maintainability of the System evaluated by IT Students

Maintainability	Weighted Mean	Interpretation
1. Modification of system is not difficult.	4.3	Excellent
2. Diagnosis of errors are easily done by system.	4.19	Very Good
3. System unable to function well after modification.	4.21	Very Good
4. System can be simply put to a test.	4.33	Excellent
5. After change in system, it can continue functioning.	4.4	Excellent
Average Weighted Mean	4.29	Very Good

As shown in Table 6, the system is rated as “Very Good” with the average weighted mean of 4.29 in terms of Maintainability of the system. Question number five achieved the highest mean among the three questions, which means that after those changes, the system can continue functioning and carry out specific tasks. Based on the findings, the system gives accurate and precise outcomes. Additionally, the system allows the users to carry out specific tasks and goals.

Table 9. Mean Distribution and Description of the Portability of the System evaluated by IT Students

Portability	Weighted Mean	Interpretation
1. The System can progress to different environment.	4.34	Excellent
2. The System can go along with portability.	4.38	Excellent
Average Weighted Mean	4.36	Excellent

As shown in Table 7, the system is rated as “Excellent” with the average weighted mean of 4.36 in terms of Portability of the system. Question number two achieved the highest mean among the two questions, which means the system can go along with the portability. Based on the findings, the system can progress to different environment and allows for portability. Additionally, the system allows the users to carry out specific tasks and goals.

**Table 10. Mean Distribution and Description of the Functional Suitability of the System
Evaluated by the IT Experts**

Functional Suitability	Weighted Mean	Interpretation
7. The system is easy to use		
8. I can easily download the data (e.g. course materials) from the system.		
9. It provides initial course outline or syllabus.		
10. It provides brief overview of the course.		
11. It is easy to create and add a new curriculum to the system		
12. I am able to delete or remove curricula when they were no longer needed.		
Average Weighted Mean		

As shown in Table 1, the system is rated as “Excellent” in terms of functionality of the system. Question number 4 got the highest weighted mean average among the other questions, which means the system provides a brief overview of the course. Based on the findings, the system gives accurate and precise outcomes. Additionally, the system allows the users to carry out specific task and goals.

**Table 11. Mean Distribution and Description of the Efficiency of the System Evaluated by
the IT Experts**

Efficiency	Weighted Mean	Interpretation

1. It is easy to navigate.		
2. The system offers a user-friendly interface.		
3. The information is presented clearly.		
4. The system facilitates collaboration and communication among different users.		
5. The system can generate analytics report using historical data.		
6. The system has mechanism for collecting users suggestions of improvement.		
Average Weighted Mean		

As shown in Table 2, the system is rated as “Excellent” in terms of efficiency of the system. Question number three got the highest score among the other question, which means the information is presented clearly on the system. Based on the findings, the system gives accurate and precise outcomes. Additionally, the system allows the users to carry out specific task and goals.

Table 12. Mean Distribution and Description of the Usability of the System Evaluated by the IT Experts

Usability	Weighted Mean	Interpretation
3. The process for entering and updating curriculum data is use-friendly.		
4. Without much effort I can use the system.		
Average Weighted Mean		

As shown in Table 3, the system is rated as “Excellent” in terms of Usability of the system. Question number one got the highest score among the other question, which means the process for entering and updating curriculum data is use-friendly. Based on the findings, the system gives accurate and precise outcomes. Additionally, the system allows the users to carry out specific task and goals.

Table 13. Mean Distribution and Description of the Reliability of the System evaluated by the IT Experts

Reliability	Weighted Mean	Interpretation
1. Errors can be controlled by the system.		
Average Weighted Mean		

As shown in Table 4, the system is rated as “Very Good” in terms of Reliability of the system. There is one question for the Reliability, and the question got 4.21, which means the system can control the error. Based on the findings, the error is under of control by the system. Additionally, the system allows the users to carry out specific task and goals.

Table 14. Mean Distribution and Description of the Security of the System evaluated by the IT Experts

Security	Weighted Mean	Interpretation
1. Each users have their own password.		

2. Security features covers System Access.		
3. System facilitates recovery procedures.		
Average Weighted Mean		

As shown in Table 5, the system is rated as “Excellent” in terms of Security of the system. Question number one achieved the highest mean among the three questions, which means the system allows each user to have different password to make the account more secure. Based on the findings, the system gives accurate and precise outcomes. Additionally, the system allows the users to carry out specific task and goals.

Table 15. Mean Distribution and Description of the Maintainability of the System evaluated by the IT Experts

Maintainability	Weighted Mean	Interpretation
1. Modification of system is not difficult.		
2. Diagnosis of errors are easily done by system.		
3. System unable to function well after modification.		
4. System can be simply put to a test.		
5. After change in system, it can continue functioning.		

Average Weighted Mean		
------------------------------	--	--

As shown in Table 6, the system is rated as “Very Good” with the average weighted mean of 4.29 in terms of Maintainability of the system. Question number five achieved the highest mean among the three questions, which means that after those changes, the system can continue functioning and carry out specific tasks. Based on the findings, the system gives accurate and precise outcomes. Additionally, the system allows the users to carry out specific tasks and goals.

Table 16. Mean Distribution and Description of the Portability of the System evaluated by the IT Experts

Portability	Weighted Mean	Interpretation
1. The System can progress to different environment.		
2. The System can go along with portability.		
Average Weighted Mean		

As shown in Table 14, the system is rated as “Excellent” with the average weighted mean of 4.36 in terms of Portability of the system. Question number two achieved the highest mean among the two questions, which means the system can go along with the portability. Based on the findings, the system can progress to different environment and allows for portability. Additionally, the system allows the users to carry out specific tasks and goals.

**Table 17. Mean Distribution and Description of the Functional Suitability of the System
Evaluated TESDA (Client)**

Functional Suitability	Weighted Mean	Interpretation
1. The system is easy to use	5.0	Excellent
2. I can easily download the data (e.g. course materials) from the system.	5.0	Excellent
3. It provides initial course outline or syllabus.	5.0	Excellent
4. It provides brief overview of the course.	5.0	Excellent
5. It is easy to create and add a new curriculum to the system	5.0	Excellent
6. I am able to delete or remove curricula when they were no longer needed.	5.0	Excellent
Average Weighted Mean	5.0	Excellent

As shown in Table 1, the system is rated as “Excellent” in terms of functionality of the system. Question number 4 got the highest weighted mean average among the other questions, which means the system provides a brief overview of the course. Based on the findings, the system gives accurate and precise outcomes. Additionally, the system allows the users to carry out specific task and goals.

**Table 18. Mean Distribution and Description of the Efficiency of the System Evaluated by
the TESDA (Client)**

Efficiency	Weighted Mean	Interpretation

1. It is easy to navigate.	5.0	Excellent
2. The system offers a user-friendly interface.	5.0	Excellent
3. The information is presented clearly.	5.0	Excellent
4. The system facilitates collaboration and communication among different users.	5.0	Excellent
5. The system can generate analytics report using historical data.	5.0	Excellent
6. The system has mechanism for collecting users suggestions of improvement.	5.0	Excellent
Average Weighted Mean	5.0	Excellent

As shown in Table 2, the system is rated as “Excellent” in terms of efficiency of the system. Question number three got the highest score among the other question, which means the information is presented clearly on the system. Based on the findings, the system gives accurate and precise outcomes. Additionally, the system allows the users to carry out specific task and goals.

Table 19. Mean Distribution and Description of the Usability of the System Evaluated by the TESDA (Client)

Usability	Weighted Mean	Interpretation
5. The process for entering and updating curriculum data is use-friendly.	5.0	Excellent
6. Without much effort I can use the system.	5.0	Excellent
Average Weighted Mean	5.0	Excellent

As shown in Table 3, the system is rated as “Excellent” in terms of Usability of the system. Question number one got the highest score among the other question, which means the process for entering and updating curriculum data is use-friendly. Based on the findings, the system gives accurate and precise outcomes. Additionally, the system allows the users to carry out specific task and goals.

Table 20. Mean Distribution and Description of the Reliability of the System evaluated by the TESDA (Client)

Reliability	Weighted Mean	Interpretation
1. Errors can be controlled by the system.	5.0	Excellent
Average Weighted Mean	5.0	Excellent

As shown in Table 4, the system is rated as “Very Good” in terms of Reliability of the system. There is one question for the Reliability, and the question got 4.21, which means the system can control the error. Based on the findings, the error is under of control by the system. Additionally, the system allows the users to carry out specific task and goals.

Table 21. Mean Distribution and Description of the Security of the System evaluated by the TESDA (Client)

Security	Weighted Mean	Interpretation
1. Each users have their own password.	5.0	Excellent

2. Security features covers System Access.	5.0	Excellent
3. System facilitates recovery procedures.	5.0	Excellent
Average Weighted Mean	5.0	Excellent

As shown in Table 5, the system is rated as “Excellent” in terms of Security of the system. Question number one achieved the highest mean among the three questions, which means the system allows each user to have different password to make the account more secure. Based on the findings, the system gives accurate and precise outcomes. Additionally, the system allows the users to carry out specific task and goals.

Table 22. Mean Distribution and Description of the Maintainability of the System evaluated by the TESDA (Client)

Maintainability	Weighted Mean	Interpretation
1. Modification of system is not difficult.	5.0	Excellent
2. Diagnosis of errors are easily done by system.	5.0	Excellent
3. System unable to function well after modification.	5.0	Excellent
4. System can be simply put to a test.	5.0	Excellent

5. After change in system, it can continue functioning.	5.0	Excellent
Average Weighted Mean	5.0	Excellent

As shown in Table 6, the system is rated as “Very Good” with the average weighted mean of 4.29 in terms of Maintainability of the system. Question number five achieved the highest mean among the three questions, which means that after those changes, the system can continue functioning and carry out specific tasks. Based on the findings, the system gives accurate and precise outcomes. Additionally, the system allows the users to carry out specific tasks and goals.

Table 23. Mean Distribution and Description of the Portability of the System evaluated by the TESDA (Client)

Portability	Weighted Mean	Interpretation
1. The System can progress to different environment.	5.0	Excellent
2. The System can go along with portability.	5.0	Excellent
Average Weighted Mean	5.0	Excellent

As shown in Table 14, the system is rated as “Excellent” with the average weighted mean of 4.36 in terms of Portability of the system. Question number two achieved the highest mean among the two questions, which means the system can go along with the portability. Based on the findings, the system can progress to different environment and allows for portability. Additionally, the system allows the users to carry out specific tasks and goals.

Table 24. Summary of the Weighted Mean of Seven Criteria

Criteria	Weighted Mean	Interpretation
1. Functional Suitability		
2. Efficiency		
3. Usability		
4. Reliability		
5. Security		
6. Maintainability		
7. Portability		
Average Weighted Mean		

CHAPTER V

SUMMARY AND RECOMMENDATIONS

This chapter further discusses the results presented in the previous chapter. Based on these discussions, this chapter briefly summarizes the study and provides the conclusions of this research. In the end, it briefly describes the issues of limitation and future research.

Discussions of Results of the Study

The objective of the study was as follow:

Develop a web-based system that will manage curriculum for Technical Education and Skills Development Authority (TESDA) in Guiguinto Bulacan.

The study likewise aims to achieve the following specific objectives:

1. *To incorporate the following significant features such as the Course creation, Archive, Curriculum file downloadable, CRUD Operations and Forum / Discussion tab.*

Based on the given catalogue by TESDA Guiguinto Branch, there are several courses in TESDA that is needed to be incorporate into the system. The system needed to be functional to create or post a course that will be shown onto the applicant side, it is important to have a course creation tab because applicants open the system for the reason that they simply looking or viewing a course. Archive is also incorporated into the system to save past historical data that has been change or delete by the admin, it was added to the system because the researcher wanted to have a past historical data for the admin to have a pattern when creating new course and to secure the data in case of something bad happened to the system.

The applicants when visiting the system can also download the curriculum, they can decide when to read the contents of the file and can save data when having problem in terms internet connectivity. CRUD operations is also incorporated in to the system because it is essential to all web-based system that interacts or manage data. That's why the system is capable of creating new course, retrieving existing course, updating or modifying the course and deleting the course.

The system also includes Forum or Discussion Tab for the applicants to ask queries or question about the course they want to apply. The admin can also reply to the forum tab to answer the applicants' question.

2. To test the system using Blackbox Testing.

The system was tested using the Blackbox testing because the researcher wanted to test the internal functions of the system. This is useful in curriculum management systems as it can immediately find reliability issues, reaction time, and how the system reacts to expected and unexpected user behaviors.

3. To provide analytics report through dashboard

The system was monitored using interactive dashboard that allows the admin to track every activity that happened on the system, includes here the number of Course that had been created, questions that were added on the Forum table, numbers curriculum file that had been downloaded based on the specific course, numbers of FAQs and News that were added on their respective table, and also how many times that admin change the VMGO. Through graphs and charts there will be a visual representation of every data that had been

4. To evaluate the system using ISO IEC 25010

The purpose of the software evaluation was to ensure that the system was acceptable to experts and target clients. The acceptability and validity were determined using ISO/IEC 25010 standard. This standard has six main characteristics or factors (Functional Suitability, Efficiency, Compatibility, Reliability, Usability, and Security). All six factors were use into the system to ensure it was acceptable to experts and target client which is the TESDA.

Limitations of the Study

The web-based system that will manage curriculum for Technical Education and Skills Development Authority (TESDA) in Guiguinto, Bulacan were able to meet the ideal requirement to create curriculum, but still far from being perfect due to some limitations in resources and time constraints.

Some limitations that are encountered are as follows:

1. Once the admin input a massive amount of data, database will possible to shut down because we only use a free webhost.
2. Weak security because the website is independent, making it vulnerable to hackers.
3. If several people use the website simultaneously, it will become sluggish.
4. The data from Forum cannot be retrieve.
5. In the update sector, the researcher can't update the image or pdf that is inserted on the certain program.

Possible Improvements

This study has several spaces for further improvement:

1. System availability in mobile platform includes the android and iOS.
2. Modifications and enhancements to the system every 2 years so that it can adapt to the current conditions within the institution.
3. The applicant can reply back to the message of the admin.
4. The date should be automated on the website.

APPENDICES

EVALUATION TOOL OR TEST DOCUMENT

The Study of Curriculum Management System in Technical Education and Skills Development Authority RTC-Central Luzon Guiguinto

Good day!

We, the undersigned 4th year Business Analytics students of Bulacan State University, currently enrolled in

CAP 401 - Capstone Project and Research 2, is inviting you to participate in our system's evaluation form for our system's validity testing under the ISO Standard 25010.

Answering this form will help our team in completing our Capstone project. Take note that this survey is for educational purposes only and rest assured that all gathered information will remain confidential.

Thank you for your cooperation!

After watching the capabilities of the system, evaluate the system features of the proposed system. Please rate the level by choosing on the column that corresponds to your assessment. Use the scale below. Numeric Value Equivalent Rating 5 - Excellent 4 - Very Good 3 - Good 2 - Fair 1 - Poor.

How does the developed system comply with the ISO 25010 software quality standards in terms of the following factors?

FUNCTIONAL SUITABILITY

1. The system is easy to use.

Mark only one oval.

<h4>BRIEF HISTORY</h4><p>The
<strong>Technical Education and Skills
Development Authority (TESDA)</strong>
was established through the enactment of
Republic Act No. 7796 otherwise known as
the“Technical Education and Skills
Development Act of 1994”, which was
signed into law by President Fidel V. Ramos
on August 25, 1994. This Act aims to
encourage the full participation of and
mobilize the industry, labor, local
government units and technical-vocational
institutions in the skills development of the
country's human resources. The merging of
the National Manpower and Youth Council
(NMYC) of the Department of Labor and
Employment (DOLE).The Bureau of
Technical and Vocational Education (BTVE)
of the Department of Education, Culture and
Sports (DECS), and The Apprenticeship
Program of the Bureau of Local
Employment (BLE) of the DOLE gave birth
to TESDA.</p>
